Modulation of inflammatory responses comprising administration of a compound *inhibiting* the binding of a *core*-2 oligosaccharide to its receptor, useful for treating inflammation
AUTHOR: *Marth J D*; *Ellies L G*
ABSTRACT: A method for modulating an inflammatory response in a mammal by administering a compound that *inhibits* the binding of a *core*-2 oligosaccharide to its receptor, is new. Also claimed are: a method for modulating the binding of a first myeloid cell to an endothelial cell or to a second myeloid cell; a method for identifying a compound for *inhibiting* inflammation by providing a cell which contains a polynucleotide encoding a *core* -2 Glc-N-acetylglucosaminyl (Nac)-transferase (EC-2.4.1.150), an acceptor saccharide for the *core* -2 GlcNAc transferase and UDP-GlcNAc, contacting the cell with a potential inflammation modulator and determining whether the level of

the *core* -2 oligosaccharide is increased or decreased; and a method for identifying lead compounds that *inhibit* inflammation in mammal but do not *inhibit* lymphocyte-mediated immune responses. The methods and compounds are useful for treatment of inflammation. (62pp)
